# Machine learning of clouds

Kuma and Bender, Machine learning of cloud types shows lower present-day bias in climate models is associated with higher climate sensitivity (manuscript in preparation)

Location of IDD stations: 2010-01-01

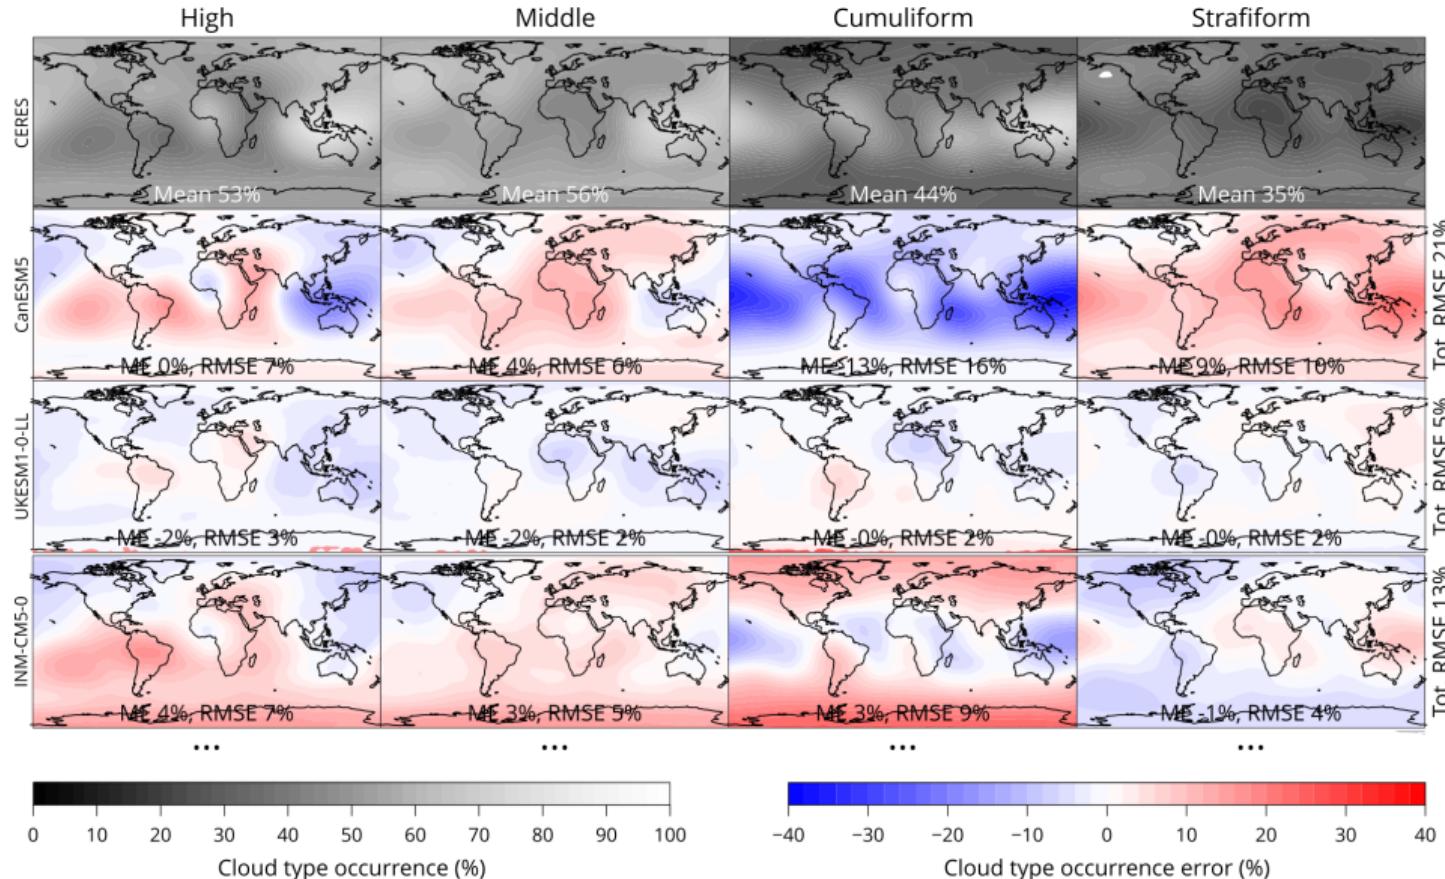

# Machine learning of clouds: Optical depth vs. cloud top pressure

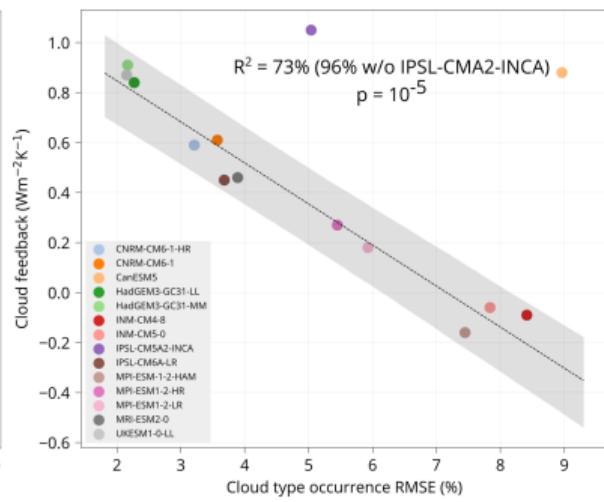

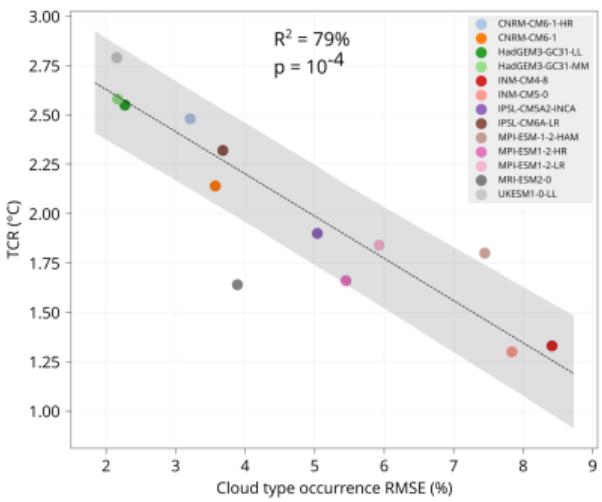

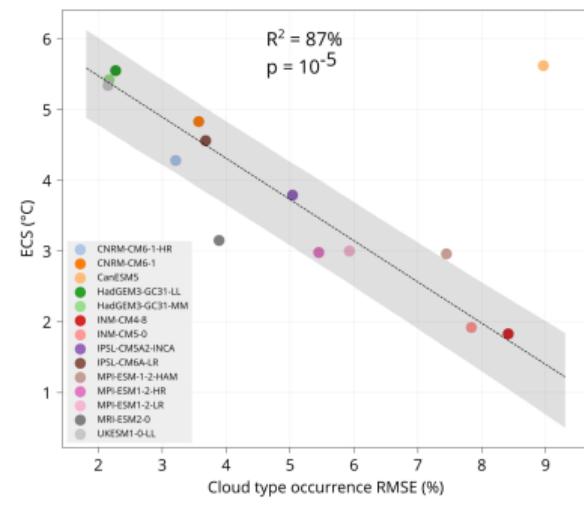

Adopted from Rossow and Schiffer (1999),  
Advances in understanding clouds from ISCCP.

# Machine learning of clouds: Geographical results

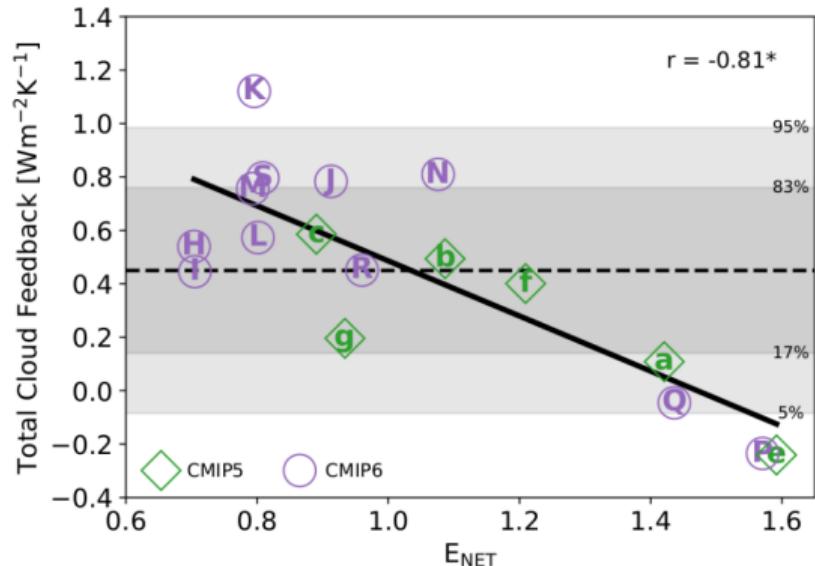

# Machine learning of clouds: Present-day cloud RMSE vs. climate sensitivity

- We see a strong linear relationship between model cloud RMSE and its climate sensitivity and cloud feedback.

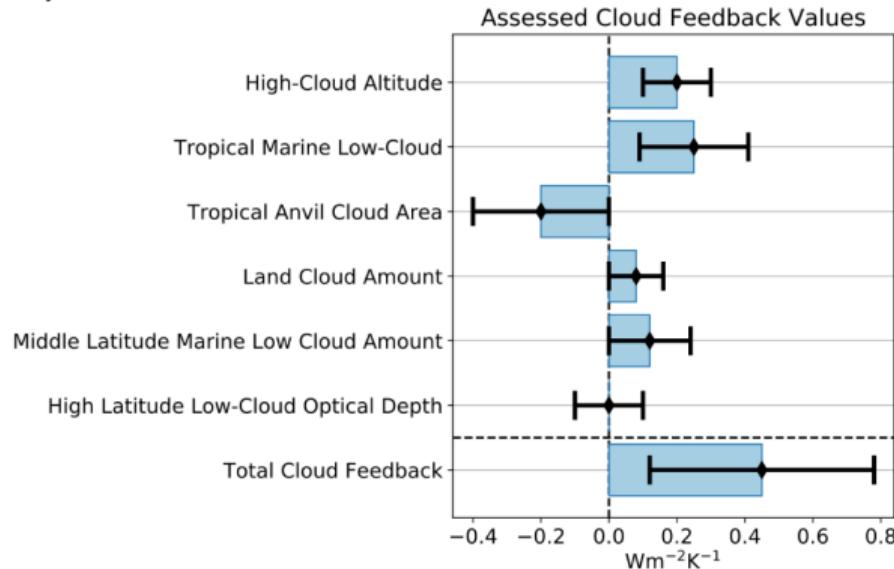

# Machine learning of clouds: What do other papers say?

a)

b)

a, Adopted from Zelinka et al. (2021), Evaluating climate models' cloud feedbacks against expert judgement (submitted).

b, Adopted from Sherwood et al. (2020), An assessment of Earth's climate sensitivity using multiple lines of evidence.

## Conclusions

- Future cloud errors are the main reason for climate sensitivity biases in climate models. Present-day cloud biases are still a problem in CMIP6, especially the Southern Ocean.
- We measured clouds and aerosol on the TAN1802 and TAN1702 Southern Ocean voyages with a ceilometer and a lidar, radiosondes, UAV and a helikite.
- Southern ocean clouds are dominated by low clouds, which are poorly observed from space. They are driven by boundary layer processes (shallow convection).
- Ground-based lidar simulator is a useful tool for comparing models and observations, available now at <https://alcf-lidar.github.io> (open source).
- The HadGEM (aka UKESM aka UM aka GA) models and especially MERRA-2 underestimate the amount of low clouds.
- Artificial neural networks can be used for determining clouds types in satellite observations and climate models. Model present-day cloud type error is strongly linked to the cloud feedback and climate sensitivity.
- Open question: Are models with better present-day representation of clouds better at simulating future clouds? If so, then high climate sensitivity is plausible.
